Peelpress

THE A4 LABEL DESIGNER

Print perfect labels, straight from your spreadsheet.

Design a sticker sheet, fill it from your data, and print at the exact physical size.

Sample names and addresses are for illustration only

THE EVERYDAY HEADACHE

Labels shouldn't mean retyping every address.

Shipping stickers, product tags, address labels. The sheet is misaligned, the data is in a spreadsheet, and half the sheet is already used.

Retyping

Copying names and addresses from a spreadsheet into a document, one label at a time.

Misaligned prints

Labels that drift off the sticker edges because the size isn't exact.

Wasted stickers

Partly used sheets thrown away because there's no way to skip the used labels.

MEET PEELPRESS

Three steps from blank sheet to printed labels.

1

Layout

Choose how the A4 sheet is divided: 4, 6, 8, 10 labels or a custom mix.

2

Design

Place text, a logo, a QR code, shapes and data fields on the label.

3

Data

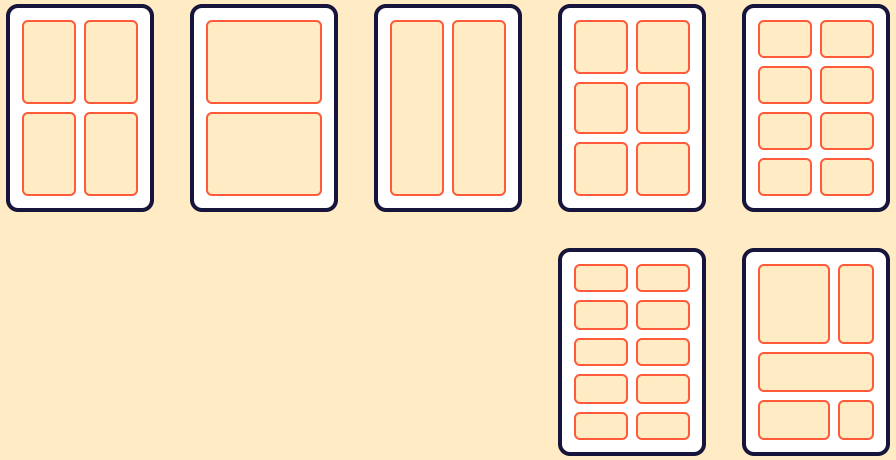

Optional. Add a CSV, Excel file, PDF or photo. Each row fills one label.

Skip step 3 to print identical labels with no data.

1 · LAYOUT

Any sheet, any label size.

- **Ready presets:** 4 labels (the default), 2 wide, 2 tall, 6, 8 or 10.
- **Exact sizes** in millimetres, with common sticker-sheet sizes to choose from.
- **Custom layouts** with mixed label sizes, snapping and alignment guides.

2 · DESIGN

Design once. Data fields fill the rest.

Write `{{Name}}` or `{{Order ID}}` inside any text box or QR code.
Each row of your data fills in its own label.

Everything you need

Text, data fields, images and logos, QR codes, boxes, circles, lines and your company info.

Starter templates

Click one to load it, such as Address Label, or save your own design as a template.

Built-in checks

Warns about text running past the edge, blurry images, QR codes too small to scan and characters that can't print.

3 · DATA

Drop in your file. One row, one label.

- Works with **CSV and Excel** files, **PDFs, photos** and pasted text.
- Columns are **matched to fields automatically**. Customer Name becomes Name, Mobile becomes Phone, Pincode becomes PIN.
- Pages are added for you as the rows grow.

Customer Name	Mobile	Pincode
Priya Sharma	98xxxxxx01	411001
Arjun Mehta	98xxxxxx02	700016
~~Neha Rao~~	~~98xxxxxx03~~	~~400050~~
Sam D'Souza	98xxxxxx04	403001

Fix values, untick rows so they don't print, add or delete rows before you download.

Sample data for illustration only

READING MESSY SOURCES

PDFs, photos and pasted text become clean rows.

An order export, a scanned list of addresses or an email. AI turns it into rows, and you check them before anything prints.

Many sources

Spreadsheets, PDFs, photos of lists and plain pasted text all work.

You stay in control

AI data is marked and you are asked to review it. Nothing prints unchecked.

Passcode protected

A passcode can protect the AI feature so only your team uses it.

CSV and Excel files are read right in the browser.

PRINT WITH CONFIDENCE

Exact size, every time.

- An **exact-size A4 vector PDF**. Labels are never stretched.
- **Start at label** to skip stickers already used on a partly used sheet.
- **Copies of each** to print every row more than once.

Download 120 labels

Print at 100% / "Actual size".

WORKS WHERE YOU DO

On your laptop, or your phone.

Phone friendly

Pinch to zoom, double-tap a label to design it, and print from the phone's share sheet.

Saved for you

Your designs and layouts are kept in your browser. Export a backup to move them to another device.

Reusable work

Save layouts with every label's design, and save your own templates to reuse.

Peelpress

Your first sheet, ready in minutes.

Pick a layout, drop in your spreadsheet and download labels that print at exactly the right size.
