TESTPILOT

Know it broke before your customers do.

Automated end-to-end testing that explores a website, writes the tests, runs them in a real browser every day and reports what is really broken.

[Your name] · [Team] · October 2026

THE PROBLEM

Websites break quietly, and customers find it first.

It breaks without warning

A contact form stops sending, a search returns nothing, a menu link leads to an error page. The site still looks fine.

Checking by hand doesn’t scale

Clicking through every page, every day, on every site takes hours, and people skip the dull parts.

Test scripts need a developer

Automated tests are written in code, and they break whenever the site’s design changes.

WHAT TESTPILOT DOES

Give it a web address. It does the whole testing job.

1

Explore

Reads every page, form, button and list, like a visitor would.

2

Write

Claude writes simple tests: one feature each, in plain words.

3

Run

In real Chrome, on demand or every day, and finds moved buttons again.

4

Report

Real problems with screenshots, a health score, and a PDF by email.

WHO IT'S FOR

Anyone who runs a website that must keep working

In-house QA teams	Cover every site without writing the test suite by hand.
Teams shipping daily	Find out what broke on the page nobody touched.
Owners of many websites	Agencies and brands: one place to watch every site they run.
Web apps behind a login	SaaS products: test the dashboard customers pay for, not just the homepage.
AI and document apps	Check the summary or answer the product actually produces.

Works on any site: WordPress, Webflow, Wix, React, Next.js and hand-built pages alike.

HOW IT WORKS

From an address to a daily report

Crawl

Pages, forms, menus, lists and search boxes, signed in if needed

Auto-Test

Claude writes the tests from what the crawl really saw

Run

Playwright drives real Chrome, step by step, with a screenshot each step

Verify

Evidence first: the page, its network answers. AI vision only where rules can’t decide

Report

Run report, project health over time, PDF emailed after scheduled runs

Scheduled projects rerun the **same** tests every day, so a test checks that a feature works, never today’s data.

WHAT GETS TESTED

Simple tests, one feature each

Test	What it proves
Page loads	Every page opens with real content, no error page
Links	Every menu and footer link answers; privacy and terms open the right page
Navigation	Each main menu item leads to its page
Forms	Every field filled with test data, sent, and the site confirms it
Search and filters	Results really contain the word or the value chosen
Widgets	Tabs, accordions, switches and carousels do what they show

HONEST RESULTS

Only real site bugs count against a site's health

Site bug

A check that ran and failed. Counts against health.

Warning

Works, but isn't what it says: a Privacy link opening Contact.

Test issue

The test is wrong, not the site: needs maintenance.

Blocked

A CAPTCHA stopped it. Reported, never bypassed.

Tool error

TestPilot's own trouble. Never blamed on the site.

Not run

Site down or login failed: the run stops and says why.

Rule one: **a false pass is worse than a false fail.** A test never passes unless its main check really ran.

SAFE ON LIVE SITES

It tests real websites without harming them

Tests run every day on production sites, so they are careful by design.

- Never a real email or phone: test addresses only
- Never changes or deletes the account it signs in with
- Never bypasses a CAPTCHA or bot protection
- Passwords go only to the site, never shown again

THE PRODUCT TODAY

A complete product, not a demo

Schedules

Daily runs, with the report emailed as a PDF; a short alert when a site is down

Reports

Per run, with step screenshots, plus a health score per project over time

Self-healing

A moved or renamed button is found again; Regenerate rewrites a test that no longer fits

Signed-in sites

Login forms, Google/Microsoft, sessions, tokens, 2FA codes; proven before every run

Accounts and plans

Sign-up with email codes, plan limits, add-ons, and an admin area

Public website

Ten marketing pages, pricing and a Book a demo form

GETTING STARTED

What a customer needs to start

The address

The website's home page. Nothing to install on the site.

A test login

Only if the site has one: a test account, plus its 2FA key if it uses one.

Report emails

Who gets the daily PDF report, and how often runs happen.

A plan

Free to try one site; Basic or Pro for daily schedules.

Then TestPilot does the rest: one Auto-Test explores the site and writes its tests in minutes, and the first run can start straight away.

PLANS

Start free, grow by websites tested

	Free	Basic	Pro
Price a month	₹0	₹1,499	₹4,999
Paid yearly, two months free	Free for good	₹14,990 a year	₹49,990 a year
Websites	1	3	10
Auto-Tests a month (TestPilot writes the tests)	2	6	20
Regenerates a month (rewrite one test)	5	30	100
Test runs a month	30	200	1,000
Scheduled runs	By hand only	Once a day	Up to 4 a day
Screenshots	Failed steps	Every step	Every step + video
Run history kept	7 days	30 days	90 days
PDF report by email	In the app only	1 address	5 addresses
“Site down” and “login failed” alerts	Yes	Yes	Yes

Add-ons: +5 Auto-Tests [₹_], +500 runs [₹_] · More than 10 websites: a custom plan on request · Paid plans set up by hand for now

WHERE IT STANDS

Checked, not just built

155

automated checks of TestPilot itself, all passing

100

SEO score on all 10 website pages

100

accessibility score on the same pages

~90

speed score, tested as a slow phone

Scores: Google Lighthouse, mobile, on a production build. Checks: TestPilot’s own test suite (node:test).

WHAT COMES NEXT

Live today. Three steps to grow.

01	**Get found on Google**	Live at testpilot.panscience.ai: set that address on the server and connect Search Console.
02	**Online payments**	Paid plans are set up by hand today; customers should be able to pay and upgrade on their own.
03	**First customers**	[Who we start with, and how we reach them]

Decision needed: **[who owns payments, and the first customers to approach]**

Thank you.
